

TOWER GARDEN TIPS

From Suzanne Daigle- “That Crazy Tower Garden Lady”

Before setting up:

Think about where your garden should go. Whether you grow indoors or out, you’ll need to set up close to a power source for your automatic timers and /or lights. If there’s no power source close by, consider using an extension cord to keep your garden running. Also keep in mind that your garden must be “level”.

After finding the perfect location for your Tower, it’s time to put it together. It only takes 30 minutes or less to assemble. While directions are included with your unit, you can also watch our straightforward instructional video:

Warranty/ Problems?

FYI - all Tower Garden components are under warranty for 5 years and the LED lights for 1 year. Should you have a problem with anything, please contact Susan or Trinette at NHFI.

Welcome!

I’m very excited to have you join our ever growing community of Tower Garden users. As a representative of the **Juice Plus / Tower Garden Company**, it is my job to provide you with dedicated customer care and support. We offer written growing guide materials and have an extensive video instructional library.

Within my website you will find a BLOG, talking about numerous Tower Garden topics from “what to grow” to “how to harvest and share your crops” and stories about “tower garden farms”. These reads are both informative and inspirational! Please check out this information at:

Thoughts about PH levels

Lots of questions about ph. This shows the nutrients and the optimum ph that a plant's roots can uptake the particular nutrient. So a ph of 5 ish to 7 ish is optimum for all the different nutrients. Don't get obsessed with ph!

Lastly.....my personal tips as you get started!

Be excited! This will be a fun adventure and may in some ways be an experiment! Gardening is not a perfect science. If a seed fails, you can always try another.

Now with your excitement you may feel you want to grow as many different things as you can. I know I did! However, like any garden, size will limit what you can grow. I like to think of each "growing pod" as a piece of prime real estate, and they must all co exist within the same neighborhood. So that tomato plant you will want to grow, will grow very large and bushy and invade upon the other plants. So will the peppers and vines such as cucumbers and peas. Other plants will grow, but ever so slowly and therefore their production time may deter you from utilizing that "spot".

Be excited and willing to try lots of things, but also remember you will have time to try it all OVER time.
